

Wooden Bed Frame for Supporting A Mattress

Abstract

Sub
F2

5 A rectangular horizontal bed frame includes a bottom wall that defines an open-topped enclosed space that contains longitudinal and transverse horizontal support slats arranged in a lattice relationship to support a bed mattress. The arrangement of the support slats eliminates the need for springs to support the mattress and creates a plurality of internal air chambers, thereby providing insulation within the apparatus. The horizontal support slats may be interchanged with various other supports to create a desired contour of the upper surface of the apparatus in

10 order to effect the position of the accompanying mattress.
